Oxford Cambridge and RSA

...day June 20XX – Morning/Afternoon

GCSE (9–1) Computer Science

J277/02 Computational thinking, algorithms and programming

SAMPLE MARK SCHEME

Time allowed: 1 hour 30 minutes

MAXIMUM MARK 80

SAMPLE MARK SCHEME

Version 1.3

This document consists of 21 pages

MARKING INSTRUCTIONS

PREPARATION FOR MARKING

SCORIS

1. Make sure that you have accessed and completed the relevant training packages for on–screen marking: *scoris assessor Online Training*; *OCR Essential Guide to Marking*.
2. Make sure that you have read and understood the mark scheme and the question paper for this unit. These are posted on the RM Cambridge Assessment Support Portal <http://www.rm.com/support/ca>
3. Log–in to scoris and mark the **required number** of practice responses (“scripts”) and the **required number** of standardisation responses.

YOU MUST MARK 10 PRACTICE AND 10 STANDARDISATION RESPONSES BEFORE YOU CAN BE APPROVED TO MARK LIVE SCRIPTS.

	Assessment Objective
AO1	Demonstrate knowledge and understanding of the key concepts and principles of computer science.
AO1 1a	Demonstrate knowledge of the key concepts and principles of computer science.
AO1 1b	Demonstrate understanding of the key concepts and principles of computer science.
AO2	Apply knowledge and understanding of key concepts and principles of computer science.
AO2 1a	Apply knowledge of key concepts and principles of computer science.
AO2 1b	Apply understanding of key concepts and principles of computer science.
AO3	Analyse problems in computational terms: <ul style="list-style-type: none">• to make reasoned judgements• to design, program, evaluate and refine solutions.
AO3 1	To make reasoned judgements (this strand is a single element).
AO3 2a	Design solutions.
AO3 2b	Program solutions.
AO3 2c	Evaluate and refine solutions.

COMPONENT 2 SECTION B SYNTAX GUIDANCE

In Section B, certain questions require candidates to answer in either the OCR Exam Reference Language or the high-level programming language they are familiar with. The information in this section provides generic guidelines in relation to the marking of these questions.

Where a response requires an answer in OCR Exam Reference Language or a high-level programming language, a candidate's level of precision will be assessed. These questions are designed to test both a candidate's programming logic and understanding of core programming structures.

Marks will be given for correctly using syntax to represent core programming constructs which are common across all programming languages. The construct must be present in a recognisable format in a candidate's answer.

Where the response requires a candidate to respond using the OCR Exam Reference Language or a high-level programming language, answers written in pseudocode, natural English or bullet points **must not** be awarded marks.

The guidance below covers the elements of each core construct. As guidance, several examples are provided for each. These examples are not exclusive but do present a variety of acceptable ways taken from a range of different languages.

Concept		Examiner Guidance
Commenting		
<pre>// //This function squares a number function squared(number) squared = number^2 return squared endfunction //End of function</pre>	<pre>function squared(number) squared = number^2 return squared endfunction //End of function</pre>	<ul style="list-style-type: none"> • Other examples allowable, e.g.: <ul style="list-style-type: none"> ○ # this is a comment ○ /* this is another comment */
Variables		
<pre>= const global</pre>	<pre>x = 3 name = "Louise" const vat = 0.2 global userID = "Cust001"</pre>	<ul style="list-style-type: none"> • Variables and constants are assigned using the = operator • Constants are assigned using the <code>const</code> keyword (or similar) • Identifiers should not have clear spaces within them or start with numbers • String values must use quotation marks (or equivalent) • Assignment must use =, :=, ← (or a suitable alternative) • variable identifier must be on the left when using OCR Exam Reference Language and the value to be assigned on the right • Some languages allow the value on the left- and the identifier on the right-hand side • Variables and constants are declared the first time a value is assigned. They assume the data type of the value they are given • Variables and constants that are declared inside a function or procedure are local to that subroutine • Variables in the main program can be made global with the keyword <code>global</code> • For input, a suitable command word for input and a variable identifier to assign data to (if required) <p>e.g.</p> <pre>INPUT identifier identifier = INPUT</pre>

Input/Output		
input(...) print(...)	myName = input("Please enter a name") print("My name is Noni") print(myArray[2,3])	<ul style="list-style-type: none"> • For output, a command word for output (e.g. output, print, cout) • Data to be output. If this is a string then quotation marks (or equivalent) are required • If multiple items are to output, a suitable symbol for concatenation such as +, &.
Casting		
str() int() real() bool()	str(345) int("3") real("4.52") bool("True")	<ul style="list-style-type: none"> • Variables can be typecast using the int str and float functions

Iteration		
for ... to ... next ... for ... to ... step ... next ...	<pre>for i=0 to 9 print("Loop") next i for i=2 to 10 step 2 print(i) next i for i=10 to 0 step -1 print(i) next i</pre>	<ul style="list-style-type: none"> • for keyword • ...with counter variable • Identification of number of times to iterate • Clear identification of which section of code will be repeated (e.g. using indentation, next keyword or equivalent, {braces})

<pre>while ... endwhile do until ...</pre>	<pre>while answer != "Correct" answer = input("New answer") endwhile do answer = input("New answer") until answer == "Correct"</pre>	<ul style="list-style-type: none"> • While / do..until key words or equivalent • ...with logical comparison • clear identification of which section of code will be repeated (e.g. using indentation, endwhile/until keyword or equivalent, braces)
Selection		
<pre>if ... then elseif ... then else endif switch ... : case ... : case ... : default: endswitch</pre>	<pre>if answer == "Yes" then print("Correct") elseif answer == "No" then print("Wrong") else print("Error") endif switch day : case "Sat": print("Saturday") case "Sun": print("Sunday") default: print("Weekday") endswitch</pre>	<ul style="list-style-type: none"> • if key word followed by logical comparison • key word for elseif or equivalent followed by logical comparison • key word for else or equivalent with no comparison • clear identification of which section of code will be executed depending upon decision • May be referred to differently in some languages. The format to the left will be used in all questions • switch/select key word or equivalent followed by variable/ value being checked • key word for each case followed by variable/ value to compare to • key word for default case (last option) • clear identification of which section of code will be executed depending upon decision

String handling/operations

<code>.length</code>	<code>subject = "ComputerScience"</code> <code>subject.length</code> gives the value 15	<ul style="list-style-type: none">• Suitable key word to indicate length and string identifier e.g. len(string)• Suitable string and characters required identified• Use of key words such as left, right, mid, etc, are all acceptable as long as these are precise• Treating a string as an array of characters is acceptable• Alternate symbol used indicate two strings or values are being concatenated is acceptable e.g. <code>stringA & stringB</code> OR <code>stringA.stringB</code>• Use of comma e.g. <code>print(stringA, stringB)</code> is acceptable to output multiple values but examiners should be aware that this is not concatenation.• Suitable key word to indicate string to be converted and whether this is to be converted to upper or lower case e.g. lower(stringname)• Suitable keyword to indicate conversion and whether this is to or from ASCII. Where converting from ASCII, an integer value must be given and where converting to ASCII, a single character must be given.
<code>.substring(x , i)</code> <code>.left(i)</code> <code>.right(i)</code>	<code>subject.substring(3,5)</code> returns "puter" <code>subject.left(4)</code> returns "Comp" <code>subject.right(3)</code> returns "nce"	
<code>+ (concatenation)</code>	<code>print(stringA + string)</code> <code>print("Hello, your name is : " + name)</code>	
<code>.upper</code> <code>.lower</code>	<code>subject.upper</code> gives "COMPUTERSCIENCE" <code>subject.lower</code> gives "computerscience"	
<code>ASC(...)</code> <code>CHR(...)</code>	<code>ASC(A)</code> returns 65 (numerical) <code>CHR(97)</code> returns 'a' (char)	

File handling		
<pre>open(...) .close() .readLine() .writeLine(...) .endOfFile() newFile()</pre>	<pre>myFile = open("sample.txt") myFile.close() myFile.readLine() returns the next line in the file myFile.writeLine("Add new line") while NOT myFile.endOfFile() print(myFile.readLine()) endwhile newFile("myText.txt")</pre>	<ul style="list-style-type: none"> • open keyword (or equivalent) • read or write clearly identified • write or read keyword (or equivalent) • close file keyword (or equivalent) • newFile keyword (or equivalent)
Arrays		
<pre>array colours[...] array gameboard[...,...] names[...] = ... gameboard[...,...] = ...</pre>	<pre>array colours[5] array colours = ["Blue", "Pink", "Green", "Yellow", "Red"] array gameboard[8,8] names[3] = "Noni" gameboard[1,0] = "Pawn"</pre>	<ul style="list-style-type: none"> • Array identifier • Index number to be accessed in square brackets, rounded brackets or curly braces (all acceptable) • Array identifier assigned to initial values in one step • For 2D arrays, the two indices should be given in one bracket separated by a comma or in two separate brackets, e.g. gameboard[4 , 6] gameboard[4][6] <p>Where 2D arrays are represented by tables in a question, candidates are expected to use the same row/column or column/row format as given in the question. This will always be given.</p>

Sub programs		
<pre> procedure name (...) endprocedure </pre>	<pre> procedure agePass() print("You are old enough to ride") endprocedure procedure printName(name) print(name) endprocedure procedure multiply (num1, num2) print(num1 * num2) endprocedure </pre>	<ul style="list-style-type: none"> • function or procedure key word (or equivalent) • ... followed by identifier • Any parameters passed in are contained within brackets and come after identifier name • Clear identification of which section of code is contained within the subroutine (e.g. indentation, endsub key word, braces)
<pre> procedure(parameters) </pre>	<pre> agePass() printName(parameter) multiply(parameter1, parameter2) </pre>	
<pre> function name (...) ... return ... endfunction </pre>	<pre> function squared(number) squared = number^2 return squared endfunction </pre>	
<pre> function(parameters) </pre>	<pre> print(squared(4)) newValue = squared(4) </pre>	<ul style="list-style-type: none"> • functions only: a suitable method of returning a value (e.g. return keyword or assignment of value to function identifier) <p>e.g.</p> <pre> def newfunction(x,y) total = x + y newfunction = total </pre>

Random numbers

random(..., ...)

myVariable = random(1,6)

myVariable = random(-1.0,10.0)

- **random** key word (or equivalent)
- identification of either smallest and largest number to be chosen **or** just largest number

e.g.

randnumber(10)

rand(1,6)

Comparison operators

==	Equal to	<=	Less than or equal to
!=	Not equal to	>	Greater than
<	Less than	>=	Greater than or equal to

Boolean operators

AND	Logical AND
OR	Logical OR
NOT	Logical NOT

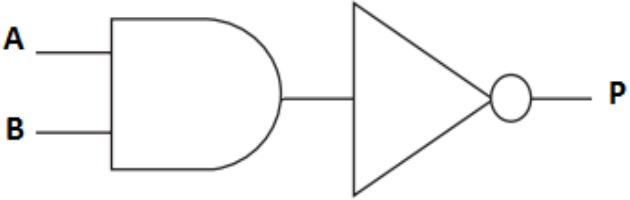

Arithmetic operators

+	Addition
-	Subtraction
*	Multiplication
^	Exponent
/	Division
MOD	Modulus
DIV	Quotient

- = or == are both acceptable for equal to.
- <> is acceptable for not equal to.
- Care must be taken by candidates to ensure that > and < are not mixed up.
- Candidates must understand that < and > are non-inclusive, so that <9 does not include 9. This is different than <=9 which is inclusive and therefore does include 9.
- Alternative symbols for arithmetic operators are acceptable where these appear in other high-level languages (such as % for MOD or ** for exponentiation).
- 6 x 5 is not an acceptable alternative for multiplication.
- Alternative logical operators are acceptable where these appear in other high-level languages (such as && for **AND**).
- Alternative Arithmetic Operators may be used as well (such as % for modulus).
- Candidates must be aware that logical operators must be used correctly:

if x > 0 AND x < 10 is logically correct.

if x > 0 AND < 10 is **not** logically correct.
